

## Resource: Configuring Downloadable ACLs on the CSACS

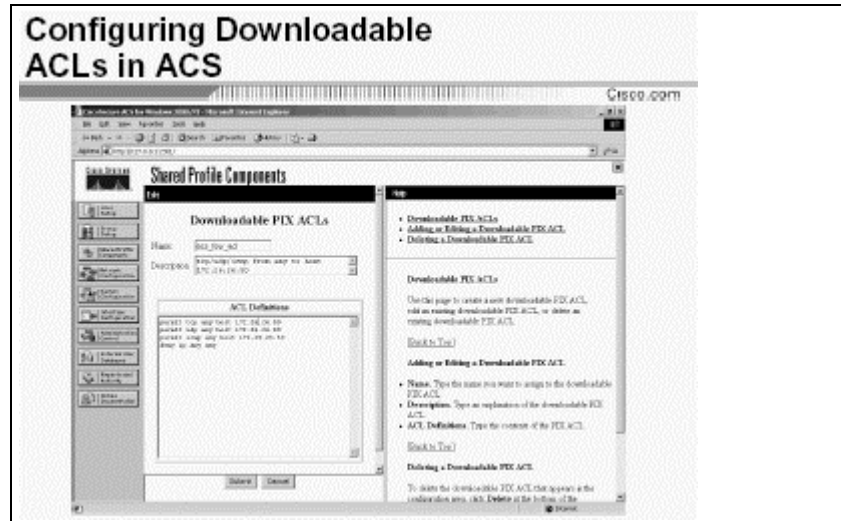

Figure [1] Configuring downloadable ACLs with CSACS

To configure named downloadable ACLs, complete the following steps on the AAA server:

**Step 1** To enable the Downloadable ACLs option, select **Interface Configuration>Advanced Options** from the main CSACS window. Within the Advanced Options group box, select the following:

- User-Level Downloadable ACLs
- Group-Level Downloadable ACLs

**Step 2** Select **Downloadable PIX ACLs** from the Shared Profile Component (SPC) menu item.

**Step 3** Click **Add** to add an ACL definition. Enter the name, description, and the actual definitions for the ACL.

The ACL definition consists of one or more PIX Security Appliance **access-list** command statements with each statement on a separate line. Each statement must be entered without the access-list keyword and the acl\_ID for the ACL. The rest of the command line must conform to the syntax and semantics rules of the PIX Security Appliance **access-list** command. A PIX Security Appliance Syslog message is logged if there is an

error in a downloaded **access-list** command. When you have finished specifying the ACL, click **Submit**.
